

EPS Solutions

“Enhanced Professional Services” – Real world solutions, services and training

Microsoft Exchange Server Solutions

E-mail is currently the most widely used collaborative technology. Exchange Server is the predominant messaging system deployed today and has a larger installed client base than any other messaging application. Exchange enables workers to gain access to critical business communications almost whenever and wherever they need to and is designed to deliver greater security, availability, and reliability.

Our consultants have been deploying and supporting Microsoft Exchange since 1996 when the first version was released. We will put our collective knowledge together to design and deploy an Exchange Server infrastructure to meet all of your messaging needs. In addition our consultants are cross-trained and certified on today's leading edge security technologies and are capable of deploying both highly available and highly secure Exchange Server messaging systems.

Our system integration services include:

Exchange Planning and Design and Active Directory Integration – whether your organization is looking to deploy a new Microsoft Exchange solution or migrate from a previous Microsoft Exchange version, planning and testing is critical. Our engineers are experienced in planning all aspects of Exchange deployments including migration. We will design the Windows 2000/2003 Site and Server topology, and the Active Directory (AD) structure required to support Exchange, including server information and how to design the AD.

Exchange Implementation – we have extensive field experience and technical depth making it possible to provide expert assistance for large and complex Microsoft Exchange email migration or fresh installation projects.

Exchange Migration and Upgrades – we are experienced in working with complex Exchange environments including enterprises with multiple sites, servers and data centers. We can also manage challenging projects such as multi-language environments, consolidation of multiple organizations into a single unified Exchange 2000/2003 system, complete re-implementation, migration/integration of legacy email systems into Exchange, and Exchange server consolidation.

Securing Exchange Environments – we will complete a security design and specify the Windows security infrastructure required for Exchange based on your existing environment. We will develop the documentation for implementation and provide assistance in getting your environment secured. We will provide security advice for effective protection of user data and protected email.

Exchange Management – we can help with tricky recovery procedures, such as corrupted Exchange databases, loss of Active Directory environment, recovery of mailboxes to an alternate server, bringing an off-site disaster recovery site on-line, troubleshooting problems with restoration from backups, or diagnosing and recovering from damage created by worms and viruses.

SYSTMS-NY specializes in providing EPS Solutions for a variety of technology platforms. We employ today's best-of-breed technologies and industry best practices to help our clients leverage and transform technology into a competitive advantage.
